Hiring Committee – Data Science, Machine Learning & Quantitative Risk

Data Science, AI & Quantitative Engineering Internship

COVER LETTER

Internship Application

Re: Application for Data Science, ML & Quantitative Fintech Internship

Dear Hiring Team,

I am a third-year Computer Engineering student at Srinakharinwirot University (SWU) and an NHK Spring Engineering Scholar (2026–2027), applying for a Data Science, Machine Learning, or Quantitative Fintech internship. Across national hackathons and independent prototypes, my focus is building tabular and graph risk models that are rigorously validated against simple baselines, calibrated for decisions, and paired with clear explanations.

In my recent engineering and competition work, I have focused on three core disciplines:

- **Baseline Benchmarking & Validation Gating (KBTG Hackathon 2026 – Top 10 Data Science):** As Concept Lead and Pitcher for K-NEXUS, I built a past-only transaction graph to prevent label leakage, showing that a tabular baseline (0.996 PR-AUC) beat 16D R-GCN + LightGBM embeddings (0.994 PR-AUC) across 1,354 synthetic transfers. When our 30-day cashflow ML candidate trailed the account-mean baseline (2,701.6 vs. 313.3 THB MAE), I gated it out for an explainable FastAPI/React rule plan.
- **Interpretable Credit Risk & Calibration (Research Prototype & Aihack 2025 Finalist):** In my Credit Risk & XAI prototype, I paired monotonic WoE binning with 5-fold Optuna LightGBM to lift Home Credit default prediction from 0.742 to 0.785 ROC-AUC (43.2% KS), calibrated to a 300–850 scorecard with TreeSHAP and DiCE recourse. At Aihack Thailand 2025 (National Finalist), I blended CatBoost and LightGBM to raise 12-month default ranking from 0.633 to 0.653 OOF ROC-AUC on imbalanced loans (~8.3% default rate).
- **Connecting Models to Operational Policy (Shopee Challenge & Production Systems):** For the Shopee Ultimate Case Challenge 2026, I trained a calibrated Random Forest (0.840 ROC-AUC on 3,500 synthetic holdout orders) and designed a 4-tier deposit policy modeling 3.58M THB/month in simulated return savings. Beyond ML, I build end-to-end delivery systems—from FastAPI, ONNX, and PostgreSQL/WebSocket telemetry views to the official SWU Open House 2026 portal.

Backed by a verified 97/150 score on the SKILLKAMP by KBTG Data Analyst STAMP (above the 90 benchmark) and CEFR B1 English proficiency on the Oxford Placement Test, I would welcome the opportunity to discuss how my background in statistical machine learning and explainable risk modeling can support your team.

Sincerely,

Sivakorn Khundilokrattaya

B.Eng. in Computer Engineering Student, Srinakharinwirot University (SWU)
