Sivakorn Khundilokrattaya

Computer Engineering Student · Data Science & Machine Learning

Building explainable decision-support prototypes in credit risk, fraud review, and e-commerce.

Seeking: Data Science / Machine Learning Internship

Bangkok, Thailand | sivakorn.khun@gmail.com | svkhun.vercel.app | github.com/svkhun | LinkedIn | Kaggle

EDUCATION

Undergraduate
Expected 2028
Bangkok, Thailand

Srinakharinwirot University - B.Eng. in Computer Engineering

- **NHK Spring Scholarship (2026-2027):** 30,000 THB/year engineering grant (eligibility GPAX ≥ 2.75); planned 2-month summer internship.
- **Assessments (2026):** KBTG Data Analyst STAMP (Score 97/150, report average: 90) and Oxford Placement Test (CEFR B1, Score 51).

SKILLS

ML & Data	Python, PyTorch / PyTorch Geometric (R-GCN), LightGBM
Inference	ONNX Runtime, FastAPI
Engineering	React, Git
Languages	Thai; English (CEFR B1, Oxford score 51)

PROJECTS

2026
KBTG Top 10 DS

K-NEXUS - FlowSense & TrustGraph

App / Showcase

- Built a past-only graph; benchmarked no-GNN average precision 0.99640 versus 16D R-GCN + LightGBM 0.99373 on 1,354 synthetic transactions (67 positives). The GNN did not beat the baseline.
- Kept FlowSense ML disabled: the 30-day forecast on 32 synthetic accounts had candidate model MAE 2,701.6 versus baseline MAE 313.3 THB/account-origin. Used history/scenario/abstention plans; ML did not beat the baseline.

2026
Research Prototype

Credit Risk Scoring & Explainable AI

GitHub

- Estimates default risk with 5-fold LightGBM: ROC-AUC 0.7854 versus WoE logistic baseline 0.7420; KS 43.17%. Results are model-development experiments.
- Maps probabilities to a 300-850 scorecard (Base 600, PDO 20), with TreeSHAP and DiCE views. Mapping establishes neither probability calibration nor lending approval.

2026
Independent Prototype

Shopee Smart COD & Adaptive Checkout

GitHub

Independent synthetic prototype; not affiliated with or endorsed by Shopee.

- Connects Random Forest with sigmoid calibration to checkout policies: ROC-AUC 0.8400, average precision 0.3056 on 3,500 synthetic holdout COD orders from 50,000 synthetic orders.
- Models 3.58M THB/month potential savings at an assumed 58% RTO reduction, using 5-99 scores and four checkout tiers; no realized savings or real-order validation.

2025
National finalist (team entry)

Long Overdue Debtor (LOD) Prediction

GitHub

- Ranks long-overdue risk with V13 CatBoost/LightGBM: attributed out-of-fold ROC-AUC 0.65333 versus baseline 0.63300 on imbalanced competition data; development experiment.
- Combines financial ratios and missingness in a synthetic example; excludes confidential records. No debt-recovery outcome established.
